Exercise 3.1:

a.

```
c = [1 1; 100 100]
```

```
c =
```

```
    1    1  
  100  100
```

```
>> inv(c)
```

```
Warning: Matrix is singular to working precision.
```

```
ans =
```

```
   Inf   Inf  
   Inf   Inf
```

b.

```
>> A = [5 3; 7 4]
```

```
>> B = inv(A)
```

```
B =
```

```
 -4.0000  3.0000  
  7.0000 -5.0000
```

```
>> B*A
```

```
ans =
```

```
  1.0000    0  
 -0.0000  1.0000
```

```
>> A*B
```

```
ans =
```

```
1.0000    0
    0 1.0000
```

c.

```
x = [2; 3]
```

```
x =
```

```
2
3
```

```
>> y = A*x
```

```
y =
```

```
19
26
```

```
>>
```

d.

I think we will get the matrix x. Because y is a multiple of A and x, multiplying it by the inverse of A will likely reduce it back down to x.

e.

```
>> B*y
```

```
ans =
```

```
2
3
```

### Exercise 3.2

Exactly 2 stops without repeating cities:

San Diego>Los Angeles>Shanghai>Manila

San Diego>Los Angeles>Tokyo>Manila

San Diego>Los Angeles>Seattle>Manila

San Diego>Seattle>Shanghai>Manila

San Diego>Seattle>Tokyo>Manila

### Exercise 3.3

a.

```
>> A = [0 1 0 0 0 1; 1 0 1 1 1 1; 0 1 0 1 1 1; 0 1 1 0 1 1; 0 0 1 1 0 0; 1 1 1 1 0 0]
```

A =

|   |   |   |   |   |   |
|---|---|---|---|---|---|
| 0 | 1 | 0 | 0 | 0 | 1 |
| 1 | 0 | 1 | 1 | 1 | 1 |
| 0 | 1 | 0 | 1 | 1 | 1 |
| 0 | 1 | 1 | 0 | 1 | 1 |
| 0 | 0 | 1 | 1 | 0 | 0 |
| 1 | 1 | 1 | 1 | 0 | 0 |

```
>> A^3
```

ans =

|   |    |    |    |    |    |
|---|----|----|----|----|----|
| 2 | 7  | 5  | 5  | 5  | 7  |
| 7 | 10 | 12 | 12 | 10 | 11 |
| 4 | 11 | 9  | 10 | 9  | 11 |
| 4 | 11 | 10 | 9  | 9  | 11 |
| 4 | 4  | 7  | 7  | 4  | 4  |
| 7 | 9  | 12 | 12 | 7  | 8  |

As we can see from the first row and fifth column, our answer is 5 which corresponds to our answer in exercise 3.2.

b.

```
>> A^2+A^3+A^4+A^5
```

ans =

|     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|
| 56  | 108 | 110 | 110 | 90  | 108 |
| 112 | 204 | 218 | 218 | 174 | 204 |
| 96  | 184 | 192 | 192 | 156 | 184 |
| 96  | 184 | 192 | 192 | 156 | 184 |
| 56  | 96  | 108 | 108 | 84  | 96  |
| 104 | 180 | 198 | 198 | 154 | 180 |

When looking at the data set, we find that the number of ways to get from Manilla to Seattle with at most four stops is 96 (5th row to 6th column).

### Exercise 3.4

a.

Function:  $(P^N) \cdot x_0$  = Prediction for election N

```
>> (P^3)*x0
```

```
ans =
```

```
0.3926  
0.4007  
0.1099  
0.0968
```

```
>> (P^6)*x0
```

```
ans =
```

```
0.3617  
0.3629  
0.1418  
0.1336
```

```
>> (P^10)*x0
```

```
ans =
```

```
0.3540  
0.3407  
0.1534  
0.1518
```

b.

```
>> (P^30)*x0
```

```
ans =
```

```
0.3546  
0.3285  
0.1570  
0.1599
```

```
>> (P^60)*x0
```

```
ans =
```

```
0.3547
```

```
0.3285
```

```
0.1570
```

```
0.1599
```

```
>> (P^100)*x0
```

```
ans =
```

```
0.3547
```

```
0.3285
```

```
0.1570
```

```
0.1599
```

As our number of elections gets larger our resulting party affiliation will gradually fall towards the trends of our current election. However, this change will begin to level off once the distribution becomes more normalized (at around  $N=40$ ). This can be seen in our last three results, as they hardly differ from each other.
